                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1108
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Requilatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immune response, e.g. in immunotherapy. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, encopathologies or other autoimmune diseases. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         360

Single copy genomic hybridization probes for detecting specific nucleic acid sequences in sample by in situ hybridization useful for detection of

acquired or inherited genetic diseases. Example 1; SEQ ID NO 21; 30pp; English.

```
historic call cycle regulation defective, S. cerevisiae homologue A; HIRA; high complexity repeat; in situ hybridisation; Southern blot; chromosome breakpoint; inherited genetic disease; neoplastic disorder; chromosome 22; DiGeorge syndrome; Velo-Cardio-facial syndrome.
                                                                                           high complexity repeat found in the HIRA gene #21

The invention relates to a nucleic acid hybridisation probe comprising a comparation single copy nucleic acids of at least 50 nucleotides, which will hybridise to a deduced single copy sequence interval in target cucleic acid (TNA) of known sequence. The single copy sequence is deduced copy sequence is deduced copy comparing the target nucleic acid (e.g. a disease causing gene) with a collection of high and low complexity repeat sequences as found in the copy sequence of the organism from containing the target nucleic acid. The probe is generated by PCR on the target sequence. The probe is essentially free cof blocking nucleic acid sequences which will hybridise to repeat copy with a label selected from fluorochrome-responsive labels, fluorochromes, calorimetric chemical, conjugated proteins, antibodies, antigens and their mixtures. The probe is useful in a hybridisation method, where the copy in the in study hybridisation method is from in situ hybridisation, southern blot, and coher methods in which nucleic acid is immobilised, where the method coher method a duplicon or triplicon sequence domain. The probe is useful for for detarmining the avierence of hybridise to a duplicon or triplicon sequence domain. The probe is useful injustings to a unplation. In the property of presence to a unplation of the existence of previously unknown repeat sequence families in a genome. The method comprises reacting a labelled probe with the genome, causing the probe to hybridises and ascertaining if the probe hybridises to the genome at more than three preferably ten different locations as a determination of new repeat sequence family, where the determining step comprises selecting the single copy sequence from a duplicon or triplicon sequence domain. The probe is useful for determining a chromosome breakpoint and is useful in the fields for cytogenetics and molecular genetics for determining the presence of specific nucleic acid sequences in a sample of eukaryotic origin, e.g. the probes may be used to analyse specific chromosomal locations by in situ hybridisation as a detection of acquired or inherited genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               900
       diseases especially for detection of genetic or neoplastic disorders. Unlike prior art techniques, the probe permits more precise chromosomal breakpoint determinations by in situ hybridisation. The genomic sequence comprising the human HIRA gene (histone cell cycle regulation defective, S. cerevisiae, homologue A) was analysed for single copy sequence intervals for use as probes of the invention. HIRA is located on chromosome 22 as a duplicate, deletions of 1 copy lead to Dideorge and velo-Cardio-facial syndromes. The present sequence is a high complexity repeat found within the human genome used to analyse the HIRA gene for repeat found within the human genome used to analyse the HIRA gene for repeat regions. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=20030224356.
                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                         300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      540
                                                                                                The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Regulatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immunotherapy. HERV-7q peptides and their coding sequences can be used in immunospanic or vaccinating compositions, for protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, neuropathologies or other autoimmune diseases. The present sequence was used to illustrate the invention

The present invention describes a method (MI) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Endress G,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ebner R,

The present sequence encodes a human endogenous retrovirus envelope protein. The specification describes a method for detecting expression of an envelope protein from a human endogenous retrovirus (HENV), in cells, of a tissue or culture. The method comprises detecting syncytia formation due to the fusogenic properties of the envelope protein. Envelope polyphylactic compositions, particularly for treatment of cancer, to correct defects in placental development (or other natural formation of other types of syncytial), and to promote adhesion of cells in grafts or cellular repair processes. Expression of sequences antisense to the polymucleotide are used to prevent formation of syncytial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACCTTCACTGCCCACACCATATGCCCCCCAACTGCTATAACTCTGCCACTCTTTGCATG

                                                                                                                                                             The present sequence represents an endogenetic retrovirus, which is associated with an autoimmune disease, and is integrated into the human genome. The retrovirus is human endogenous retrovirus (HERV-W). The HERV-W retrovirus is associated with autoimmune disease, failure of pregnancy or disorders of pregnancy. HERV-W nucleic acid fragments, or proteins derived from it, are useful for diagnosis of autoimmune disease (specifically multiple sclerosis) and for monitoring pregnancy. The nucleic acid fragments may also be used for in situ labelling of isolated chromosomes, while the transcription product can be used to study or monitor T cell proliferation in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
New nucleic acid from human endogenous retrovirus, useful e.g. for diagnosis of autoimmune disease and complications of pregnancy, contains at least part of the gag gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       121 ACGCGGCTTCCTGGAAATATTGATGCCCCATCATATAGGAGTTTATCTAAGGGAAACTCC

```
This sequence represents the complete sequence of the human endogenous retrovirus (HERV) W genome. The nucleic acids, their fragments or peptides encoded by them are markers of autoimmune disease (e.g. multiple sclerosis, rheumatoid polyarthritis, disseminated lupus erythematosus, insulin- dependent diabetes and related pathologies) and of abnormal or unsuccessful pregnancy and can be used as chromosomal markers for susceptibility to these conditions, or proximity markers of genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid sequences from human endogenous retrovirus-W - expressed exclusively in placenta and useful in diagnosis and therapy of autoimmune disease, and abnormal or failed pregnancy.
                                                                                                                                                                                                                                                                                                                                                       Clone; human endogenous retrovirus; genome; autoimmune disease; multiple sclerosis; rheumatoid polyarthritis; insulin-dependent diabetes; disseminated lupus erythematosus; pregnancy; chromosomal marker; ss.

New human retrovirus HERV-W ENV proteins/peptides having superantigen activity useful for diagnosing and treating multiple sclerosis.

Claim 13; Fig 9; 94pp; English

Con the basis of the PBS t-RNA motif used for the classification of human endogenous retrovirus (HERVS) the full length endogenous provirus which endogenous retrovirus (HERVS) the full length endogenous provirus which endogenous retrovirus (HERVS) the full length endogenous proteins which designated HERVYW. The present invention describes proteins or peptides of HERVYW, the surface protein (SU) and transmembrane (TM) sub-units. (I) having superantigen activity, and cransmembrane (TM) sub-units. (I) have neuroprotective activity, and can be used in: vaccines; antisensetherapy; and HERVYW SAG activity-inhibitors. (I) and encoding DNA/RNA are useful for diagnoshing multiple sclerosis (MS) or HERVYW and optionally recovering) capable of binding to a retroviral superantigen associated with MS; substances capable of blocking SAG activity and substances capable of blocking transcription or translation of HERVW retroviral superantigen associated derived from (I), modified to be devoid of SAG activity and being capable of generating an immune response against HERV-W retroviral superantigen associated with MS; or capable of blocking SAG activity, capable of blocking transcription or translation of HERV-W retroviral superantigen associated with MS; or capable of blocking transcription or translation of HERV-W retroviral superantigen sasciated with MS; or capable of blocking transcription or translation of HERV-W retroviral superantigen for use in treatment and preventing MS. (b) and nucleic acide encoding them are useful for diagnosing autoimmune disease. The present sequence encodes the georifically claimed envelope protein of HERV-W designated G encoding them are useful for specifically claimed envelope protein of HERV-W designated G

                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents clone cl. PH74 of the human endogenous retrovii (HERV) W genome. The nucleic acids, their fragments or peptides encode by them are markers of autoimmune disease (e.g. multiple sclerosis, rheumatoid polyarthritis, disseminated lupus erythematosus, insulindependent diabetes and related pathologies) and of abnormal or unsuccessful pregnancy and can be used as chromosomal markers for susceptibility to these conditions, or proximity markers of genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ACGCGGCTTCCTGGAAATATTGATGCCCCATCATATAGGAGTTTATCTAAGGGAAACTCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents an endogenetic retroviral nucleic acid fragment, which is associated with an autoimmune disease, and is integrated into the human genome. The fragment is originally derived from a novel retrovirus, human endogenous retrovirus W (HERV-W). The HERV-W retrovirus is associated with autoimmune disease, failure of pregnancy or disorders of pregnancy. The nucleic acid fragment, or proteins derived from it, are useful for diagnosis of autoimmune disease (specifically multiple sclerosis) and for monitoring pregnancy. The nucleic acid fragments may also be used for in situ labelling of isolated chromosomes, while the transcription product can be used to study or monitor T cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present DNA sequence was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynuclectides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                        Wang J;

(I). The polynucleotides (I) can be used as hybridisation probes, oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA. The present sequence represents a human contig polynucleotide sequence, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1430 ATGGCCTCCCTTATCATATTTTTCTCTTTACTGTTCTTTTACCCTCTTTCACTCTCACT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes isolated polynucleotide sequences (I), which encode polypeptides (II) with biological activity. Also described: (1) a vector comprising (I); (2) an expression vector comprising (I); (3) a host cell genetically engineered to comprise (I) which is operatively associated with a regulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide (II) encoded by (I); (5) a composition comprising the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (I) or the polypeptide of (4) in a composition of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4) in a collection of polymucleotides comprising at least one of the polymucleotide sequences
                                                                                                                                                                                       1374
                                                                                                                                                                                                                      2809

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              32274
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           32394
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  32094
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            32334
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             31974
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            32454
                         The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Regulatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immunotherapy. HERV-7q peptides and their coding sequences can be used in immunotherapy. HERV-7q peptides and their coding protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, endogenous certovictuses that are abnormally expressed in cancer, used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                       <u>ب</u>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      480

```
The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Regulatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immunotensponse, e.g. in immunotherapy. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, endogenous retroviruses that are abnormally expressed in cancer, used to illustrate the invention
                                                                                                                                 New nucleic acid sequences of human endogenous retrovirus, HERV-7q, us-
for diagnosis, treatment and prevention of autoimmune and neurological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           101798
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      are associated with carcinomas. The sequences are useful for: (i) for screening drug candidates; (ii) for screening of bioactive agent capable of bioactive agent capable of bioactive agent capable of modulating the activity of CAP; (iii) for screening of a bioactive agent capable of amodulating the activity of CAP; (iv) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vii) for inhibiting the activity of CAP; (vii) for treating carcinoma; (vii) for neutralizing the activity of CAP; (vii) for treating carcinoma (vii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number in addition, the CA genes are useful as DAA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. Note: This patent is an equivalent to basic patent US2002182586A1, for which no sequence data was published
                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant nucleic acid useful for diagnosis and treatment of carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present invention relates to novel DNA and protein sequences which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 161334 BP; 46474 A; 28689 C; 31549 G; 54602 T; 0 U; 20 Other;

The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q.

Regulatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immune response, e.g. in immunotherapy. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   caccecerceárdecachecacecercearececerceareceáraderecerráde 1022

The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                    gene expression analysis in human cervical cell sample.

The single exon nucleic acid probes may be used for predicting, measuring and single expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the printed at ftp.wipo.int/pub/published_pct_sequences

Penn SG, Hanzel DK, Cnen W, Kank DK; WPI; 2001-488897/53.	Human genom gene expres Claim 25; S	C The present invention relates to single exon nucleic acid probes (SE) CC The present sequence is one such probe. The probes are useful for CC producting a microarray for predicting, measuring and displaying gene	for antenat. The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived nucleic acid probes for measuring gene expression in a sample derived concletion than breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this partent did not form part of the prince apecification, but was obtained in electronic format directly from WIPO at the princes.
                                       New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.

The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, dispnosing, grading, staging, the monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leuksemia and myeloma. The present sequence is one of the probes of the invention

They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepy and cancers. The present sequence is one of the probes of the invention

ugle exon nucleic acid probe (SENP) (I) for on in a sample derived from human adult by defined nuclectide sequences given in the life fragments). The probe hybridises at high molecule expressed in the human adult liver. It adult liver the genes identified may be leases such as cirrhosis, ipidaemia and hypercholesterolaemia which is the desase. ABS2501-ABS25105 represent human d probes of the invention. Note: The patent does not appear in the printed in electronic format directly from WIPO at

1363 1423 CIGGACCTIGGGGCCTCCTCAGCCAATGGATGCCCTGGATTCTCCCCCTTCTTAGGACCTC 1184 The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, breast. The probes are useful for predicting, diagnosing, grading, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and noncarcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences expression in Probe, human, breast disease, breast cancer, development disorder, ss, inflammatory disease, proliferative breast disease, non-carcinoma tumour. probes,

CC complements or the 12387 open reading frames derived from the 12614

Cybobes. Also included are a microarray comprising the novel set of probes

c i the novel set of probes which hybridise at high stringency to a nucleic

acid expressed in the human lung; measuring gene expression in a sample

CC acid expressed in the human lung; measuring gene expression in a sample

CC collection of detectably labeled nucleic acids derived from human lung

CC algorithmically predicting at least one exon from genomic sequences of

the eukaryote; and (b) detecting specific hybridisation of detectably

CL labeled nucleic acids from eukaryote; genome, comprising (a)

algorithmically predicting at least one exon from genomic sequences of

the eukaryote; and (b) detecting specific hybridisation of detectably

CL shabeled nucleic acids from eukaryote lung mRNA, to a single exon probe,

CM having a fragment identical to the predicted exon, the probe is included

in the above mentioned microarray; assigning exons to a single gene,

C comprising (a) identifying exons from genomic sequence by the method

above and (b) measuring the expression of each of the exons in several

CC tissues and/or cell types using hybridisation to a single exon

comprising a probe with the exon, where a common pattern of

microarrays having a probe with the exon, where a common pattern of

concorsishon of the exons in the tissues and/or cell types indicates that

CC fills sequences, mentioned in the specification, or encoded by the

concor, chronic obstructive pulmonary disease (COPD), interstitial lung

cancer, chronic obstructive pulmonary disease (COPD), interstitial lung

disease (LID), familial ideopathic pulmonary disease such as asthma, lung

cancer, chronic obstructive pulmonary disease (COPD), interstitial lung

cancer, chronic obstructive pulmonary disease.

CC probes/open reading frames (ORF)

concorsis, lymphangioleionyomens and hyaline membrane disease. The

CR fargeners syndrome, fibrocyetic pulmonary dysplasia, primonary

cyntensed syndrome ftp.wipo.int/pub/published\_pct\_sequences

                                                                                                                                                                                                                                                                                                                                                       This sequence represents clone cl.24.4 of the human endogenous retrovirus (HERV) W genome. The nucleic acids, their fragments or peptides encoded by them are markers of autoimmune disease (e.g. multiple sclerosis, rheumatoid polyarthritis, disseminated lupus erythematosus, insulindependent diabetes and related pathologies) and of abnormal or susceptibility to these conditions, or proximity markers for associated with this susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     360
